
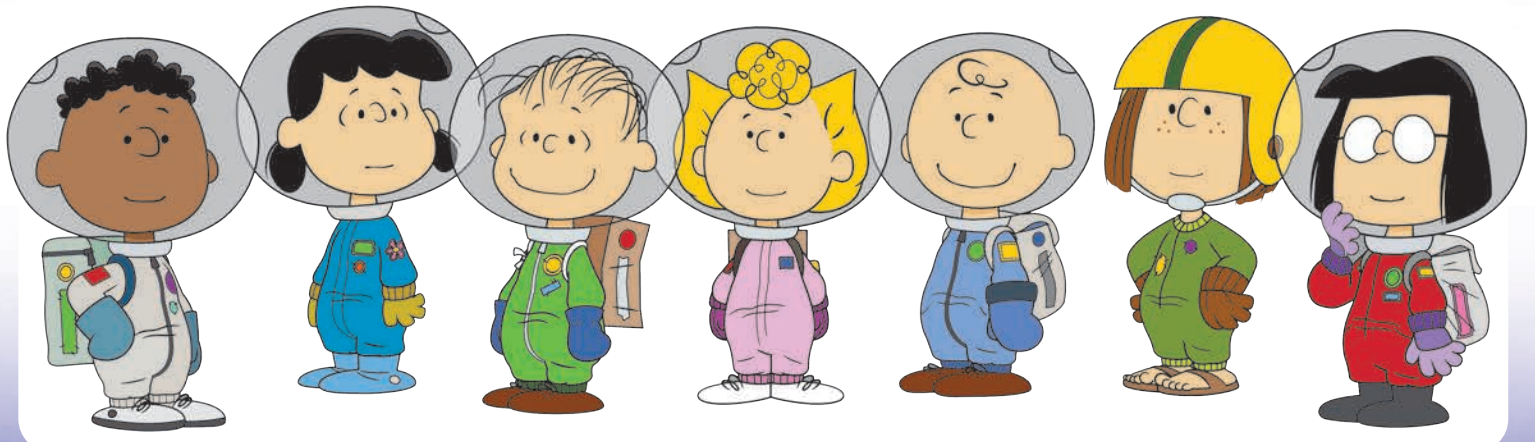
Life in Deep Space

The universe is vaster than we can imagine. Scientists say it is continually expanding, and there are billions of galaxies, each with billions of stars — and each one of those stars could have planets orbiting it. In fact, scientists have already discovered more than 4,000 *exoplanets* (planets that orbit a star beyond our solar system), as the Peanuts Gang learns in *Snoopy in Space*.

Looking at these numbers, you can see why many people believe that life exists on other planets in the universe. What are the odds, they ask, that Earth is the *only* planet with life? What do you think? Use this space to write about whether you think life exists on other planets, and include your reasons.



FAMILIES! Learn more about NASA's thrilling search for life on other planets by joining Snoopy and the Peanuts Gang's adventures in season 2 of *Snoopy in Space*, now streaming on Apple TV+.
